

The process begins when the customer **either** *Places an Order Online* **or** *Places an Order In-Person*.

Next, they must choose one payment method: *Pay Using Cash*, *Pay Using Debit Card*, **or** *Pay Using Credit Card*.

After payment, the order preparation splits into **two exclusive options**: *Prepare Standard Order* **or** *Prepare Custom Order*.

Once prepared, the order delivery branches again: it can be *Delivered to Home Address* **or** *Picked Up In-Store*.

Finally, the *Complete Order* step is executed, ending the process.

All steps follow one after another, with exclusive choices at each branching point. No tasks occur simultaneously, and there are no loops.
