

Here's a clear description of the process flow using everyday language:

Start when the system *Receives order*. Then **two separate paths happen at the same time**:

Path 1: Order Handling

1. *Either*:

- *Process customized order*

Or (exclusively):

- *Process standard order*

2. **Next, two tasks happen together**:

- *Manufacture product*

- *Assemble accessories*

3. **Then, two final delivery tasks occur simultaneously**:

- *Customer pickup*

- *Prepare shipment*

Path 2: Payment Handling

1. *Generate Invoice*

2. *Either (exclusively)*:

- *Auto-deuction of payment (automatic payment)*

Or:

- **Two parallel tasks**:

- *Add Invoice to system*

- *Mail Invoice*

3. **Next for both payment options**:

- *Finalize payment*

Finally:

- **Only when both paths finish** (after delivery tasks and payment are done), the system *Finalizes order* to complete the process.

No steps repeat (no loops), and every activity listed is included. Parallel tasks are explicitly marked as working together, while exclusive choices are shown as "either/or" options.
