

The process begins when **Gather new product requirements** is performed. Next, the flow splits into **two parallel branches** that happen simultaneously:

1. **Business planning** is conducted.
2. **Technical preparation** is conducted.

Both branches must finish before moving forward.

After both tasks are completed, the process splits again into **two new parallel branches**:

1. **Product development** occurs.
2. **Sales development** occurs.

These two branches work separately and simultaneously. Once both finish, they merge back together.

Finally, **Product release** is executed, and the process ends.

Silent transitions (unnamed steps) guide the flow by splitting and merging paths, ensuring all required tasks complete before moving to subsequent steps. No loops or exclusive choices exist in this process.
